DETAILED ACTION

Drawings

1. Figures 8, 9, 10A, 10B, 11, 12, 13A, 13B, 14A and 14B should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance.

Specification

- 2. The lengthy specification has not been checked to the extent necessary to determine the presence of all possible minor errors. Applicant's cooperation is requested in correcting any errors of which applicant may become aware in the specification.
- 3. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Phase Voltage Controlled Voltage Regulator Of Vehicle AC Generator.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 5. Claims 1, 2, 8-10, and 13-18 are rejected under 35 U.S.C. 102(b) as being anticipated by U.S. Patent No. 5,093,583 A to Mashino et al.

Application/Control Number: 09/922,690

Art Unit: 2834

Mashino et al. clearly teaches the construction of an electric power supply system for automobile including:

a rotor having a plurality of magnetic poles and a field coil (12) for polarizing said plurality of magnetic poles,

an armature (10) having an armature core with a plurality of phase windings for generating AC voltage under the influence of rotating magnetic field provided by said rotor,

a pulse detecting means (Figure 1) for detecting the number of frequency or pulses of said output signal of said comparator, wherein said field coil is energized to polarize said plurality of magnetic poles if the number of frequency or pulses of said input signal is the same as or larger than a predetermined level, and

a full-wave rectifier (11) for converting said AC voltage into DC voltage, said voltage regulator comprising:

a phase voltage input terminal (Figure 1) connected to one of said phase windings;

a phase-voltage-detection circuit / a sub-power circuit (Figure 1), connected to said phase voltage input terminal, for detecting phase voltage of said one of said phase windings and generating a rotation signal if it detects said phase voltage;

a main power circuit (Figure 1), connected to said sub-power circuit, for supplying power;

a field current switching element (Figure 1) connected to said field coil;

Page 4

Application/Control Number: 09/922,690

Art Unit: 2834

a voltage control circuit (13), connected to said main power circuit, for monitoring the output voltage of said full-wave rectifier and generating a control signal that controls said field current switching element so that said output voltage of said full-wave rectifier can be controlled at a prescribed level;

wherein said phase-voltage-detection circuit / sub-power circuit comprises:

a comparator (Figure 1) having a first input terminal connected to said input terminal and a second input terminal, and means, connected to said second input terminal, for providing a variable threshold level varying with said phase voltage,

an integration circuit having an output terminal connected to said first input terminal, for providing a mean value of said phase voltage,

a peak hold circuit having an output terminal connected to said second input terminal of said comparator, for detecting peak values of said one of phase voltage,

a second comparator having a first input terminal connected to said phase-voltage- input terminal and a timer circuit 82 connected in series with said second comparator for providing a certain interval before a next phase voltage,

a second resistor,

a switching element connected in series with said second resistor,

Page 5

Application/Control Number: 09/922,690

Art Unit: 2834

a third comparator having a first input terminal connected to said phase-voltage-input terminal for controlling said switching element.

Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 3-7, 11 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent No. 5,093,583 A to Mashino et al. in view of common knowledge in the art.

Mashino et al. discloses the claimed invention except for:

the variable threshold level correspondence value, the crossing value and frequency per cycle, the frequency value of the voltage regulator, and the field current supply period.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to select the claimed range of values for the variable threshold level correspondence value, crossing value and frequency per cycle, the frequency value of the voltage regulator, and the field current supply period since it has been held that where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. In re Aller, 105 USPQ 233.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to select the claimed values for the variable threshold level correspondence

Application/Control Number: 09/922,690

Art Unit: 2834

value, crossing value and frequency per cycle, the frequency value of the voltage regulator, and the field current supply period since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. <u>In re Boesch</u>, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

It would have been an obvious matter of design choice to select the claimed ranges and set the claimed values since the applicant has not disclosed that those ranges and values solves any stated problem or is for any particular purpose and it appears that the invention would perform equally well with any appropriate working values depending on system capacity and operation.

It should be emphasized that "apparatus claims must be structurally distinguishable from the prior art." MPEP 2114. In re Danly, 263 F. 2d 844, 847, 120 USPQ 528, 531 (CCPA 1959) it was held that apparatus claims must be distinguished from prior art in terms of structure rather than function. In Hewlett-Packard Co v Bausch & Lomb Inc., 909 F.2d 1464, 1469, 15 USPQ2d 1525, 1528 (Fed. Cir. 1990), the court held that: "Apparatus claims cover what a device is, not what it does." (emphases in original). To emphasize the point further, the court added: "An invention need not operate differently than the prior art to be patentable, but need only be different" (emphases in original). That is, in an apparatus claim, if a prior art structure discloses all of the structural elements in the claim, as well as their relative juxtaposition, then it reads on the claim, regardless of whether or not the function for which the prior art structure was intended is the same as that of the claimed invention.

Application/Control Number: 09/922,690

Art Unit: 2834

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Pedro J. Cuevas whose telephone number is (703) 308-4904. The examiner can normally be reached on M-F from 8:30 - 6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nestor R. Ramírez can be reached on (703) 308-1371. The fax phone numbers for the organization where this application or proceeding is assigned are (703) 305-1341 for regular communications and (703) 305-3432 for After Final communications.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is (703) 308-0956.
